## **Project Design Phase-II**

## 3.4Technology Stack (Architecture & Stack)

| Date          | 31 Janaury 2025    |
|---------------|--------------------|
| Team ID       | LTVIP2025TMID32100 |
| Project Name  | Citizen AI         |
| Maximum Marks | 4 Marks            |

## **Technical Architecture:**

The Deliverable shall include the architectural diagram as below and the information as per the table 2

| S.No | Component           | Description  | Technology   |
|------|---------------------|--|--|
| 1.   | User Interface      | Chatbot interface for user interaction (issue reporting, Q&A). | Gradio, HTML, CSS.                                 |
| 2.   | Application Logic-1 | Handles routing, query preprocessing, response formatting      | Python, FastAPI                                    |
| 3.   | Application Logic-2 | AI model interaction and natural language understanding        | <b>IBM Granite 3.3</b> , Hugging Face Transformers |

| 4.  | Application Logic-3             | Query classification and response generation logic                | Python-based logic & custom intents               |
|-----|---------------------------------|---|---|
| 5.  | Database                        | Optional storage for FAQs, schemes, issue categories              | JSON files / SQLite (optional)                    |
| 6.  | Cloud Database                  | For storing user queries, feedback, issue logs (future scope)     | IBM Cloudant, Firebase (optional)                 |
| 7.  | File Storage                    | Storing logs, screenshots (if uploaded), or static JSON files     | Local Filesystem / IBM Object<br>Storage (future) |
| 8.  | External API-1                  | To fetch area-specific government service information (future)    | e-Seva / RTI APIs (future integration)            |
| 9.  | External API-2                  | (Optional) To verify user or connect to citizen services          | Aadhar API, etc.                                  |
| 10. | Machine Learning<br>Model       | Understand and respond to user queries in natural language        | IBM Granite Model / Fine-tuned<br>Transformers    |
| 11. | Infrastructure (Server / Cloud) | Deployed via Google Colab; can migrate to IBM Cloud or local host | Google Colab, IBM Cloud,<br>Local/VM, Docker      |

**Table-2: Application Characteristics:** 

| S.No | Characteristics             | Description  | Technology   |
|------|-----------------------------|--|--|
| 1.   | Open-Source<br>Frameworks   | Frameworks and tools used to build the platform  | Gradio (Python), FastAPI, Hugging Face Transformers  |
| 2.   | Security<br>Implementations | Application-level security (basic for now, expandable)                                       | Token-based access, HTTPS (when deployed), basic auth Future: OAuth2, IAM, OWASP practices |
| 3.   | Scalable<br>Architecture    | Modular backend, pluggable AI, potential for microservices and API gateways                  | Microservices-friendly: FastAPI + AI Models separated                                      |
| 4.   | Availability                | Can be deployed to cloud, supports scaling through containerization and serverless platforms | IBM Cloud, Docker, Cloud Foundry (optional)  |
| 5.   | Performance                 | Optimized for fast inference using lightweight models, Gradio sessions cached                | GPU-enabled Colab, Caching in FastAPI (future), Preloaded responses                        |
